SUMMARY

DevOps Engineer with 1.5+ years of hands-on experience in designing and managing CI/CD pipelines, containerization, and cloud infrastructure. Skilled in Docker, Kubernetes, GitHub Actions, AWS, and Azure DevOps, with a strong focus on automation, scalability, and system reliability. Seeking to contribute to a growth-oriented organization by optimizing deployment processes and building efficient, secure cloud environments.

EXPERIENCE

Junior DevOps Engineer

January 2025 – Present

Quiddity

Pakistan

- Designed and deployed production AWS infrastructure (VPC, EC2, EKS, MSK, ALB, Route53) using Terraform reducing manual provisioning time and ensuring repeatable, version-controlled environments.
- Developed end-to-end CI/CD pipelines with GitHub Actions, Docker, and HashiCorp Vault automating deployments and enforcing secrets management best practices across all environments.
- Containerized applications using Docker and configured NGINX as a reverse proxy and load balancer, improving application resilience and horizontal scalability.
- Implemented monitoring with Prometheus, Loki, and Grafana dashboards.
- Managed DNS (BIND), firewall rules, and security policies for production workloads.

Junior DevOps Engineer

June 2024 – December 2024

Software Development Hub

Remote/Hybrid

- Deployed a large-scale monolithic PHP application on Apache servers, managing server configuration, virtual hosts, and environment setup across staging and production.
- Provisioned and managed AWS infrastructure including EC2 instances, Application Load Balancer (ALB), Security Groups, and IAM roles ensuring secure and highly available hosting for production workloads.
- Built and maintained GitHub Actions CI/CD pipelines to automate build and deployment workflows, reducing manual intervention and accelerating release cycles for the development team.

PROJECTS

AWS Infra Automation with Terraform | *Terraform, AWS VPC, EC2, EKS, RDS, S3*

- Automated end-to-end provisioning of production-grade AWS infrastructure VPC, EC2, ALB, EKS, RDS, MSK, and security groups using Terraform modules, eliminating manual console setup entirely.
- Configured Terraform remote backend with S3 state storage and versioning, enabling safe team collaboration and reliable rollback on infrastructure changes.
- Enforced least-privilege IAM security policies and environment-specific variable configs across dev and production workspaces, reducing misconfiguration risk.
- Structured reusable Terraform modules for core components, reducing code duplication and making infrastructure changes auditable through version-controlled IaC.

CI/CD Pipeline for Node.js App | *GitHub Actions, Docker, GHCR, Node.js*

- Designed and implemented a fully automated CI/CD pipeline using GitHub Actions triggering builds, automated tests, and Docker image pushes to GitHub Container Registry (GHCR) on every pull request and merge to main.
- Containerized the Node.js application with Docker and orchestrated multi-service environments using Docker Compose, ensuring environment parity between development and production.
- Reduced manual deployment overhead by automating the full build-test deploy lifecycle, enabling faster and more reliable release cycles.

CI/CD Pipeline for .NET App | *GitHub Actions, Docker, ACR, Azure App Service*

- Built a fully automated CI/CD pipeline for a .NET application using GitHub Actions triggering builds and Docker image pushes to Azure Container Registry (ACR) on every pull request and merge to main.
- Configured GitHub Actions to deploy directly to Azure App Service by pulling the latest container image from ACR, enabling consistent and repeatable cloud deployments without manual intervention.
- Enforced branch protection rules and PR-based triggers to ensure no unreviewed code reached production, improving code quality and deployment safety.

- Deployed and managed production infrastructure for a live UK-based online tutoring platform on AWS using Docker Compose for multi-container orchestration across backend services.
- Configured AWS Application Load Balancer (ALB) with ACM SSL/TLS certificates for HTTPS termination and Elastic IP for stable, DNS-mapped public access ensuring zero-downtime deployments.
- Set up Apache as a reverse proxy routing traffic across backend servers, handling load distribution and securing internal service communication.
- Implemented monitoring stack with Prometheus to track uptime, request metrics, and server health across production environments.

TECHNICAL SKILLS

Infrastructure as Code: Terraform)

Containers: Docker, Kubernetes

CI/CD Tools: GitHub Actions, Azure DevOps, Jenkins

DevSecOps & Security: SonarQube (SAST), Lynis (Host Hardening System Audit) Nikto (Web Server Security Assessment), IAM, CloudTrail, GitLeaks (Secrets Detection), Trivy (Container Scanning), HashiCorp Vault (Secrets Management)

AWS Cloud: EC2, S3, Lambda, SQS, IAM, VPC, EIP, ALB, ECS, RDS, MSK(Kafka), Route53, ACM, Secrets Manager

Azure Cloud: VMs, Blob Storage, VNet, Container Instances, SQL DB, Key Vault

Monitoring & Logging: Prometheus, Grafana, Loki, ELK Stack (basic familiarity)

Networking: DNS, Firewalls, Load Balancing, TCP/IP

Scripting: Bash scripting

Version Control: Git, GitHub

EDUCATION

Abasyn University

Bachelor of Science in Computer Science

Islamabad

Jan 2021 – Dec 2024

COURSES & CERTIFICATIONS

Certified Kubernetes Administrator (CKA) – KodeKloud

Terraform Associate – KodeKloud

AWS Certified Solutions Architect – Associate – Udemy

AWS Cloud Practitioner – AWS

GitHub Actions Certification – KodeKloud

Loki & Grafana Monitoring – KodeKloud

Docker – KodeKloud

Mastering Linux – Udemy
